Wisdrop agent chain - README

2026-11-06

Version 2, 2026-11-06. Each prompt is now **fully self-contained**: role, inputs and their validation, numbered steps with time and token budgets, every rule inlined with its FM id, exact output schemas, a worked example from ep01 OneCoin, a self-check, the exact owner-gate message, error handling, hand-off and token-saving rules. An agent never needs to open another document. The long reference stays in `docs/` (DIRECTOR_PROMPT, FAILURE_MODES, SHOTS, AI_MOTION_CRAFT, EDITING_CRAFT, RETENTION, THUMBNAILS, PUBLISH_CHECKLIST); if a prompt and a repo doc ever disagree, the repo doc wins and the agent flags it in one line.

Which file to paste where

agent	file	paste into	needs	start with
1 Research + Writer	`01_research_writer.md`	any AI chat with web browsing (system prompt or first message)	web access	`Start. Episode folder: episodes/<epNN-slug>. Constraints: <...>`
2 Director	`02_director.md`	any capable AI chat; attach agent 1's files	no tools needed (repo helps for free checks)	`Direct episodes/<ep>.`
3 Builder	`03_builder.md`	an AI with code execution + the repo + GitHub workflow access (Hark project, Codex, Claude Code, etc.)	repo, gh/GitHub connector	`Build episodes/<ep>, chapter c01 first.`
4 Voice + Finisher	`04_voice_finish.md`	same as agent 3	repo, GitHub workflows	`Voice and finish episodes /<ep>.`

Use a **new chat per agent**. In a plain chat without code, agents 3 and 4 print exact commands and workflow inputs; you run them and paste back the JSON results.

The chain

```
AGENT 1  Research + Writer   ->  topics.md                                  OWNER GATE 1: pick the topic
                             ->  brief.md, research.md, beats.md, bible.md, hooks.md,
                                 script.md, lines.json, titles.md, package_draft.md
                                                                            OWNER GATE 2: approve script + cast
                                                                            (merge PR gate/<ep>/script)
AGENT 2  Director            ->  chapters.json, chapters.md, scenes.md, shots.json, director_check.md
AGENT 3  Builder             ->  chapter previews (c01 first), qa/*.json, build_log.md
                                                                            OWNER GATE 3: approve the chapter-1 look
AGENT 4  Voice + Finisher    ->  voice QC + retakes, full cached run = one film, seams.md,
                                 mastered video.mp4, captions, package/, thumbnails
                                                                            OWNER GATE 4: final video + thumbnail +
                                                                            title + AI disclosure (merge FINAL REVIEW PR)
OWNER uploads (never an agent)
```

Hand-off files

file	written by	read by	format defined in
topics.md	1	owner	01 section 5 (weighted score /100)
brief.md, research.md	1	2, 4	01 sections 6-8 (fact table F01.., two sources per key number)
beats.md, hooks.md	1	2	01 sections 9, 11
bible.md	1	2, 3, 4	01 section 10 (names, say spellings, palette, music, counter ledger)
script.md, lines.json	1	2, 3, 4	01 section 12 (lines.json schema + ep01 excerpt)
titles.md, package_draft.md	1	4	01 section 13

file	written by	read by	format defined in
chapters.json, chapters.md	2	3, 4	02 section 8 (schema `schemas/chapters.schema.json`, ep01 example)
scenes.md, shots.json	2	3	02 sections 9-10 (field reference + ep01 excerpt)
director_check.md	2	3, owner	02 section 11
build_log.md, qa/*.json	3	4	03 section 6
seams.md, package/, captions	4	owner	04 sections 8-9

Owner gates (an agent never passes one for you: FM-O01, FM-K10)

gate	when	you see	you do
1 topic	after topics.md	top 3 with scores and risks	reply with a row number
2 script + cast	after lines.json	runtime, hook, title, open items	merge PR `gate/<ep>/script` or send line ids + notes
3 chapter-1 look	after c01 renders	preview link, checks, cost	approve, or say what to change (cheap now)
4 final	after the full run	video, thumbnail, title, AI-disclosure recommendation, cost	merge the FINAL REVIEW PR; then upload yourself

Token cost note

A longer prompt costs a little more input on every turn (about 7-11k tokens per prompt; cached by most providers after the first turn). It saves far more: no exploring the repo, no guessing formats, fewer wrong outputs and far fewer redo rounds, which are the expensive part (a redo of research or a render costs more than the whole prompt many times over).

Never bend (all agents)

Never draw a real person (FM-L03). Every number sourced, key numbers twice (FM-R01, FM-R02). No secrets anywhere (FM-X12). Frugal: free checks first, test small, redo only what changed (FM-X08, FM-X09, FM-X10). Absolute dates, times with zone. Licences CC0 / PD / CC BY / CC BY-SA / MIT only (FM-P06). Owner approves before any upload (FM-K10).

Files

PDFs for reading: `WISDROP_AGENT_1_RESEARCH_WRITER.pdf`, `WISDROP_AGENT_2_DIRECTOR.pdf`, `WISDROP_AGENT_3_BUILDER.pdf`, `WISDROP_AGENT_4_VOICE_FINISH.pdf`, `WISDROP_AGENT_CHAIN_README.pdf`. Paste the `.md` files, not the PDFs.
